

“Will Diagnostic Systems for FASD in Children Work in Adults?”

8th International Research Conference on Adolescents and Adults with FASD April 19th
2018

Dr. Jonathan Down
Developmental Paediatrician
Victoria, BC.

“We need to talk”

Objectives

- To identify the limitations of any diagnostic system for FASD
- To identify some of the challenges of a diagnostic assessment for FASD in adults
- To describe the medical and social components of a diagnostic assessment for FASD in adults

Diagnostic system: medical

CMAJ GUIDELINES CME

Fetal alcohol spectrum disorder: a guideline for diagnosis across the lifespan

Jocelynn L. Cook PhD, Courtney R. Green PhD, Christine M. Lilley PhD, Sally M. Anderson PhD, Mary Ellen Baldwin, Albert E. Chudley MD, Julianne L. Conry PhD, Nicole LeBlanc MD, Christine A. Looch MD, Jan Lutke, Bernadene F. Mallon MSW, Audrey A. McFarlane MBA, Valerie K. Temple PhD, Ted Rosales MD; for the Canada Fetal Alcohol Spectrum Disorder Research Network

The consequences of prenatal alcohol exposure were first described more than 40 years ago.^{1,2} The term “fetal alcohol syndrome” (FAS) was first used to describe the cluster of birth defects due to prenatal alcohol exposure (including growth restriction, craniofacial abnormalities and intellectual disabilities) with lifetime consequences.³ The term “fetal alcohol spectrum disorder” (FASD) has since been adopted to describe a broader spectrum of presentations and disabilities resulting from alcohol exposure in utero. The prevalence has been estimated at 1 in 100 people, which translates to more than 330 000 affected individuals in Canada.³

The development of clinical capacity for FASD diagnosis remains difficult,⁴ because the diagnosis requires a medical evaluation and neurodevelopmental assessment conducted by a multidisciplinary team. In 2005, an international, collaborative, evidence-based guideline for diagnoses related to prenatal alcohol exposure was published.⁵ Since then, the field has evolved, and additional evidence, expertise and experience have emerged to suggest that a revision was required to improve both diagnoses and outcomes. The literature has also shown that impairments in behaviour and function associated with FASD have been detected from exposure to binge drinking, even infrequently or early in pregnancy, which underscores the importance of pre-pregnancy counselling. Specific research involving infants, young children and adults with FASD, as well as further insight into the neurodevelopmental dysfunction and nomenclature, prompted the update and revision process. A literature review and broad consultation process was undertaken to revise the 2005 guideline for diagnosing FASD.⁵

Scope

Recommendations are focused on the diagnostic process and are geared toward members of multidisciplinary diagnostic teams in Canada, who have received the required expertise and experience through specialized training. Although primary health care providers, who provide antenatal care and counsel individuals considering pregnancy, may also benefit from these recommendations, the diagnostic process should not be performed in isolation; multidisciplinary input is required.

Methods

Guideline steering committee

A 14-member steering committee was formed in September 2012. Members were selected by the Canada Fetal Alcohol Spectrum Disorder Research Network based on previous involvement with the 2005 diagnostic guideline, expertise in FASD and expertise in areas requiring specific attention (e.g., diagnostic guidelines for infants and young children, and adults; nomenclature; and the neurodevelopmental assessment criteria). The committee consisted of four psychologists, three researchers, three pediatricians, one social worker, one clinical geneticist, one FASD clinic coordinator and one parent of individuals living with FASD.

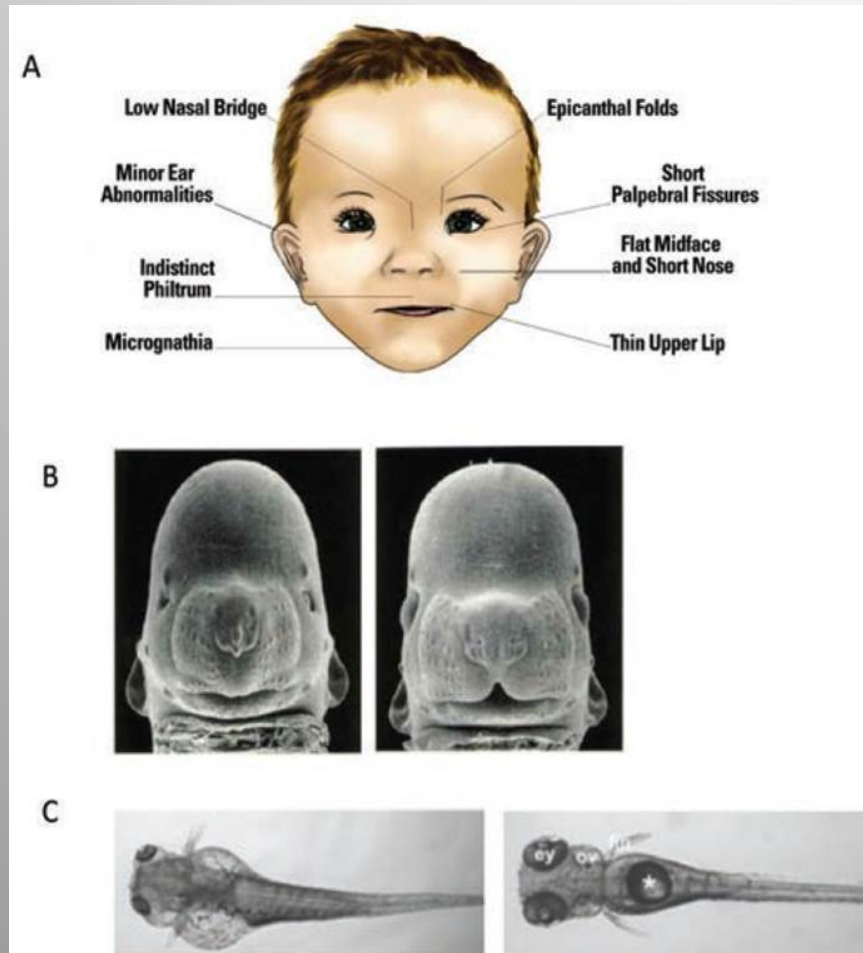

KEY POINTS

- Fetal alcohol spectrum disorder (FASD) is a diagnostic term describing the constellation of effects that result from prenatal alcohol exposure.
- Making a diagnosis of FASD requires a multidisciplinary team and involves a complex physical and neurodevelopmental assessment.
- Diagnosis of FASD is critical to improve outcomes for affected individuals and families, and to inform pre-pregnancy counselling to prevent future cases.

- Diagnosis
- Disorder
- Disability
- Dysfunction
- Disease
- Deficit
- Deficiency
- Deviation
- Defective
- Designation (not a diagnosis)

Diagnostic System : medical

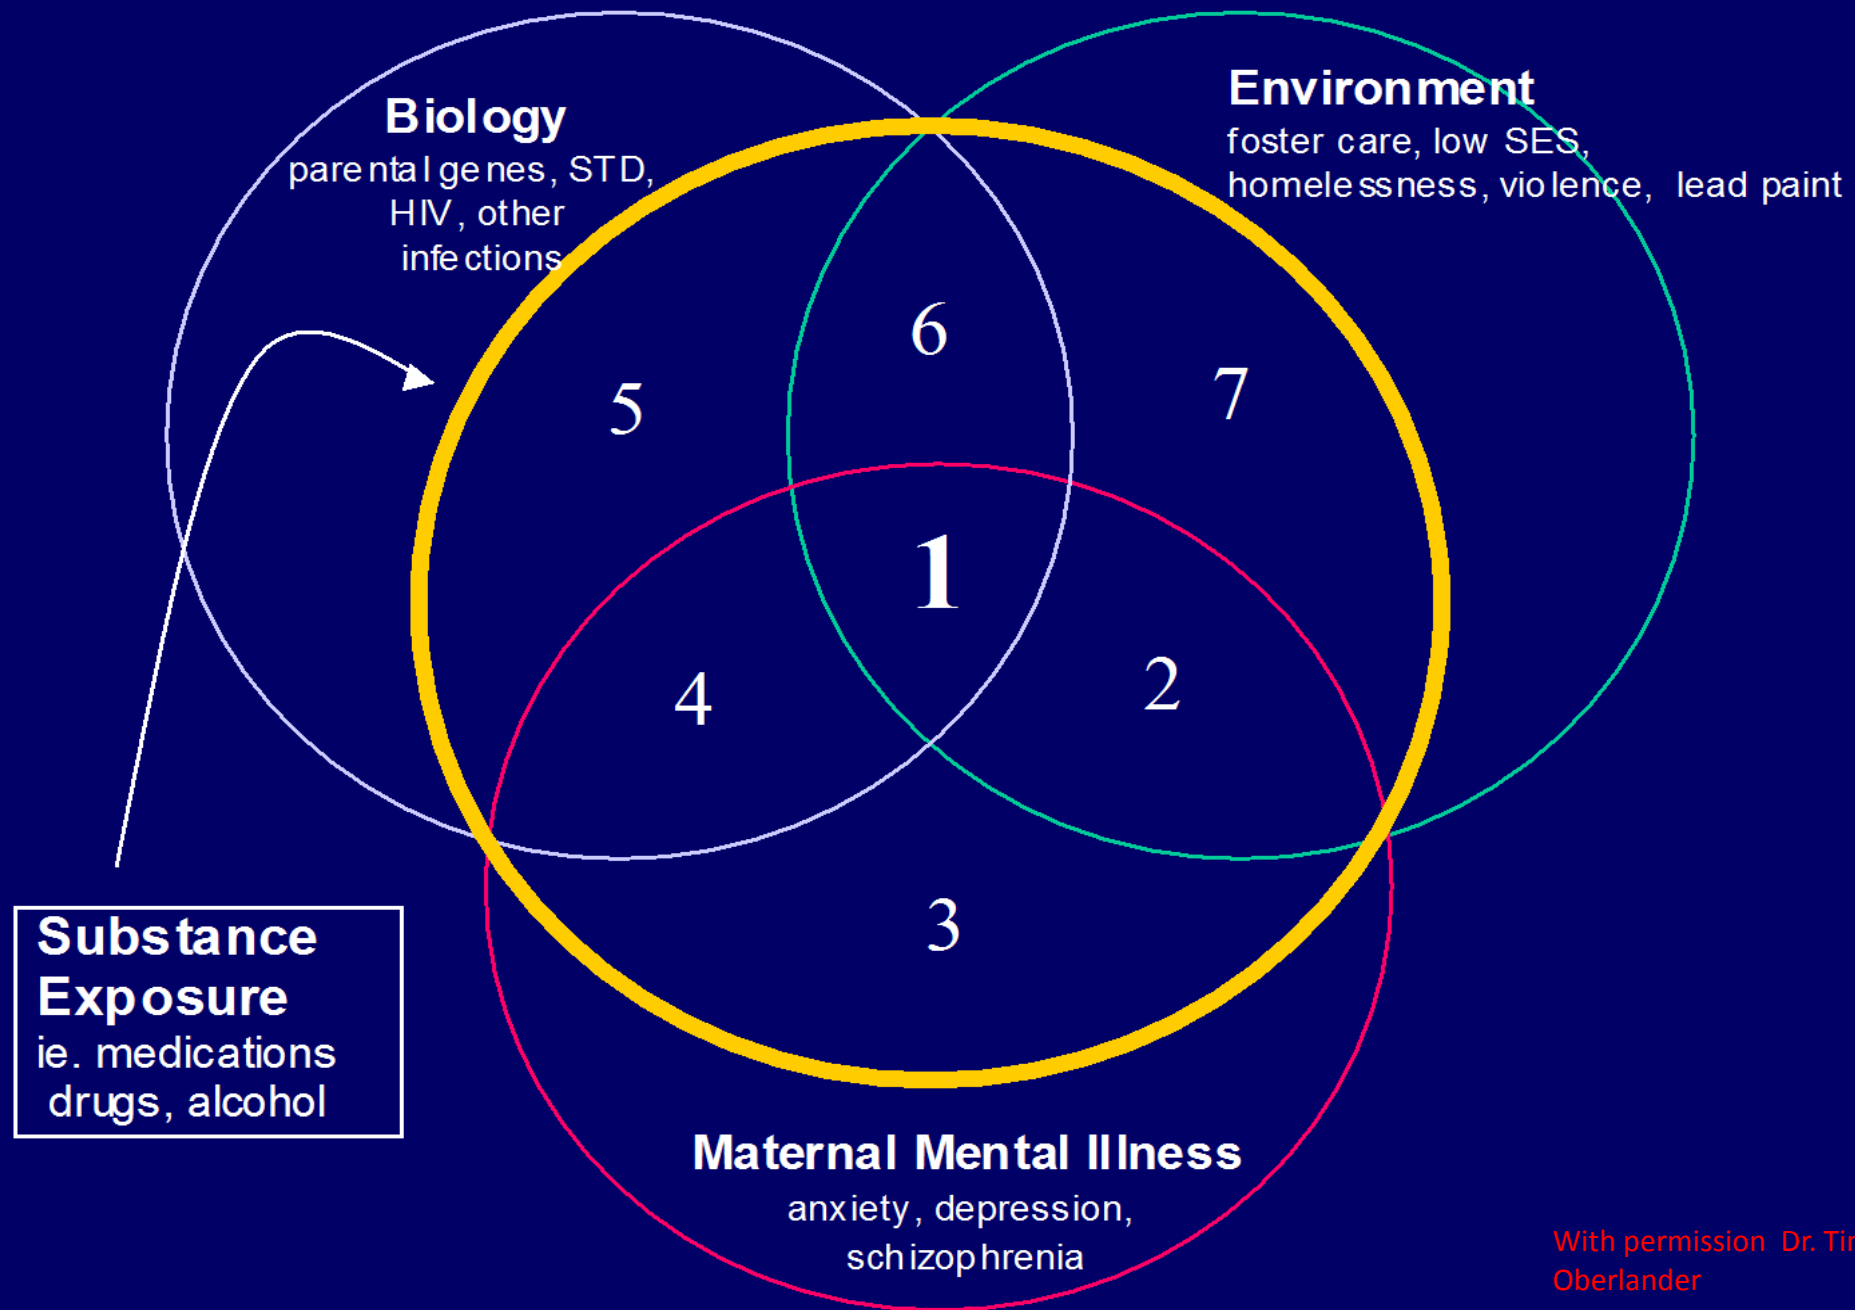

- Animal models
- Teratogenic effects
- Increased awareness
- Educational tool
- No human equivalent
- Multiple risk factors in real life
- Measurement is core feature-quantitative

Diagnostic System : social

- Function
- Resiliency
- Talents
- Assets
- Ability
- Strengths
- Protective

Schema for Understanding Developmental Risk

ADVERSE CHILDHOOD EXPERIENCES

WALEC | Wales

Welsh Adverse Childhood Experiences (ACE) Study

Adverse Childhood Experiences
and their impact on health-harming behaviours in the Welsh adult population

ALCOHOL USE, DRUG USE, VIOLENCE, SEXUAL BEHAVIOUR, INCARCERATION, SMOKING AND POOR DIET

The cover features a blue-tinted photograph of a person with long, messy hair and their hands pressed against a window. Below the main title, there is a row of seven icons representing various adverse experiences: a cocktail glass, a hand holding a cigarette, a hand holding a pill, a hand holding a knife, a hand holding a gun, a hand holding a bottle, and a hand holding a fist. The background image shows a person in a dark hoodie sitting on a bench outdoors, looking down at a bottle on the ground.

Adverse Childhood Experiences
and their association with Mental Well-being in the Welsh adult population

Welsh Adverse Childhood Experiences (ACE) Study

The cover features a blue-tinted photograph of a young child sitting on the floor with their head buried in their arms, and a woman in the foreground with her hands covering her face, suggesting distress or mental health issues. The background image shows a person sitting on a bench outdoors, looking down at a bottle on the ground.

Adverse Childhood Experiences, chronic disease and health service use in Wales

Adverse Childhood Experiences (ACEs) have harmful impacts on health and well-being across the life course. The Welsh ACE Study measured exposure to nine ACEs in the Welsh population and their association with chronic disease development and health service use in adulthood.

47% of adults in Wales suffered at least one ACE as a child and 14% suffered four or more

Proportion of Welsh adults suffering each ACE

Non-medical determinants of health

Health behaviours

- Smoking
- Heavy drinking
- Physical activity during leisure time
- Breastfeeding practices
- Fruit and vegetable consumption
- Bicycle helmet use

Living and working conditions

- High school graduates
- Post-secondary graduates
- Unemployment rate
- Long-term unemployment rate
- Low income rate
- Children in low income families
- Average personal income
- Median share of income
- Government transfer income
- Housing affordability
- Crime incidents
- Adults and youths charged
- Household food insecurity

Personal resources

- Sense of community belonging
- Life satisfaction

Environmental factors

- Exposure to second-hand smoke at home
- Exposure to second-hand smoke in vehicles and public places
- Lead concentration
- Bisphenol A concentration
- Mercury concentration

Specific problems with adult diagnosis

- Confirmation of PAE
- Sentinel facial features
- Informed Consent-ethics

Specific problems with adult diagnosis

- Adaptive measures-do they capture the real problems?
- How do we address discrepancy between the individual and third party ?

Rating Example – Adaptive

- Lower part of chart is area of difficulty
- Red and green lines by independent raters show many difficulties
- Blue line is client self-report – does not indicate much difficulty

Specific problems with adult diagnosis

- Are we doing good?
- Medical and psychiatric conditions e.g. hypertension and substance abuse-access to service?
- Logistical support for assessment-\$\$?

Specific problems with adult diagnosis

- Personal support initiative (PSI)-how low is low?
- Patient and client (medical and social)
